VALVE BASE ADAPTORS

If the valve base required does not appear on the Valve Holder Panel it is necessary to use an adaptor which plugs into an existing valve holder. These are supplied as follows:

No. 1. B7G and B8A *	No. 11. B5A (5-pin flying lead)
No. 2. B9G	No. 12. B9D *
No. 3. B8B Loctal	No. 13. B10B *
No. 4. B3G	No. 15. UX4 †
No. 5. Blank	No. 16. UX5 †
No. 6. SM7 (SA7 Base)	No. 17. UX6 †
No. 7. Noval *	No. 18. UX7 †
No. 8. Continental 8 pin (F8)	No. 19. MO8 †
No. 9. B7A	No. 20. B7 †
No. 10. 5AA and 7AA (Acorn Valves)	

* Not required for VCM 163. † For VCM 163.

Whilst every care has been taken in the preparation of this manual to ensure that the data given is correct, the Company cannot accept any responsibility for damage caused to a valve under test, or the instrument, due to the inclusion of incorrect information.
The Trade Marks AVO and AVOMETER are the exclusive property of AVO Limited.

Notes

This data manual is primarily intended for use with the *AVO* Valve Characteristic Meter VCM 163, the Valve Characteristic Meters Mk. 1, 2, 3 and 4, the *AVO* Valve Testers CT 160 and VT 160, but once the Selector Switch code is understood, the manual also forms a quick and convenient guide for general use.

The Instruction Book which accompanies the instrument should be thoroughly studied before the data contained in this manual is used.

Important:

In the interests of accuracy, it is not recommended that these instruments should be used with a constant voltage transformer, unless it is known that the 3rd and 5th harmonic content is of negligible proportion.

Abbreviations.

D, DD, DDD, Diodes and multiple diodes.

DT, DDT, DP. DDP. Valve with another electrode assembly in addition to the diode.

H Heptode or Hexode.

N Nonode.

O Octode.

P Pentode or Tetrode. **PP** Double Pentode or Double Tetrode.

T Triode. **TT** Double Triode. **TH** Triode Heptode or Triode Hexode.

TP Triode Pentode.

R Rectifier. **RR** Full-wave Rectifier.

TI Tuning Indicator (magic eye).

CCR Cold Cathode Rectifier.

† Appearing among ROLLER SELECTOR switch numbers, refers to third diodes in triple diodes. Refer to Working Instructions, Chapter 3, Section headed "Instruction for Testing Specific Valve Types" for full test procedure.

() Where brackets appear around stated heater voltage thus (5) it indicates that heater voltage given in Data columns has been uprated to allow for voltage drop at valve base, due to higher current taken by the particular valve.

Testing Wire ended (flying lead) Valves.

Wire-ended (flying lead) valves may be tested by inserting individual wires into appropriate electrode connections of a suitable valve holder in correct sequence.

Back Emission.

Alternative test figures are given for use when valves show signs of back emission from anode to G3. This phenomenon can be recognised by the anode current apparently decreasing as the valve heats up. Data to which this note refers is indicated thus "ξ".

Grid Bias.

When using *AVO* Characteristic Meter Mark I and II, to check valves requiring a bias of less than 1 volt, erroneous readings may be obtained due to the valve drawing grid current, which has the effect of reducing the grid bias voltage thus producing low mutual conductance readings. Users of these instruments are, therefore, advised to use the alternative data which has been supplied, which is indicated thus Ø.

Internal Connection. (*).

When the symbol * appears among the Selector Switch set up figures, it indicates that an unknown electrode may be connected to this pin internally. To obtain the complete Selector Switch coding, test with an ohmmeter between pin marked * and all others. (The ohmmeter should be on a sufficiently low range to discriminate between a dead short and filament resistance). Dependent upon the electrode to which this pin is internally connected the correct code can be set up and normal test procedure followed.

Tuning Indicators.

Special procedures are required for testing cathode ray tuning indicators, full details of which are given in the Operating Instructions of each instrument.

The screen grid switch is used to connect the target supply, and the voltage required is given in the Vg2 column of this data manual.

An external anode load resistor is required and should be connected between the Anode Link terminals on the valve holder panel, after removing the shorting bar. The value of the anode load resistor required for the particular indicator under test is given in the $\uparrow R_a$ column.

At the approximate bias given in the table the triode section should be at cut-off and the "eye" fully closed. On reducing the grid bias to zero the "eye" should open fully and the anode current should be approximately that given in the table. In the case of double sensitivity indicators giving multiple images corresponding to the different sensitivities, two sets of data (wherever possible) are given, the first set relating to the sensitive indication.

Valve Testers CT 160 and VT 160 only.

Insulation Testing.

The manufacturers of certain specialised types of valve, e.g. VHF types, thyratrons etc., limit the maximum applied inter-electrode voltage to very low values; these restrictions apply with the valve either hot or cold.

In these *AVO* Characteristic Meters, the peak value of the applied insulation potential is 150V; whilst this is perfectly satisfactory for the vast majority of valves listed, users are advised to check with the manufacturers' data sheets when special types are to be tested.

The majority of valves listed in the *AVO* Valve Data Manual are not subjected to this limitation, but where valve data is not given, care should be exercised. Where valves are subject to this limitation they are indicated thus □.

Low Anode Impedance Triodes.

It has come to our notice that a number of valves included in the Valve Data Manual which, when tested, produce low anode currents, a typical example being the 6080 valve.

These valves have moderately high mutual conductance coupled with a very low R_a . In the case of the 6080 this is in the order of 250 ohms. Ideally, when testing this type of valve, the source impedance should be negligible. Unfortunately, with the Valve Characteristic Meter, the source impedance is in the order of 200 ohms, most of which is due to the anode current measuring circuit. Under normal conditions this impedance is negligible when compared with the anode impedance of the valve under test; when these low impedance types are being tested, the valve is effectively being tested under dynamic conditions. Whilst we appreciate the difficulties with this drawback, we feel it is still acceptable, bearing in mind that the instrument will adequately test some 5000 ordinary valve types.

One suggestion for easing this difficulty is that a valve is selected which, when tested under d.c. conditions, meets the manufacturers' specifications. This valve should then be used under the same conditions in the Valve Characteristic Meter and the variation in anode currents and mutual conductance should then be noted and used as a guide when testing valves of the same type.

Since only manufacturers' data is included in this publication, anode current and mutual conductance figures have been omitted and the valve has been indicated thus △.

APPENDIX I

TEST DATA FOR HIGH VOLTAGE RECTIFIERS

The following procedure should be adopted when testing high voltage rectifiers.

Make insulation checks with valve cold end hot as stated in paragraphs 1 and 2 of the Abbreviated Working Instructions.

Then set Anode and Screen Voltage switches to their minimum value (i.e. 20) and Anode Current Controls to figure shown in Data column. With circuit Selector set to TEST and Anode Selector at A1 increase Anode Volts setting until indicating meter reads in a forward direction.

The setting of the Anode Voltage switch for a good valve should not exceed the figure given in column headed Anode Volts.

When checking full wave or voltage doubler rectifiers, check second Anode with Anode Selector at A2.

NOTE:—The valve should be heated to working temperature before setting Circuit Selector to position TEST and only left at this position for sufficient time to take a reading.

APPENDIX II

TEST DATA FOR 'SERVICE' TYPE VALVES

NOTES REFERRED TO IN THE REMARKS COLUMN

- A The heater/cathode lead identified with red marking should be connected to Pin No. 1.
 B The grid top cap is situated over Pins No. 7 and 8.
 C This valve does not fit special valve holders supplied, and roller selector Data will depend on connections made to valve electrodes.
 D Pin No. 1 on the flat pinch type of base is the lead adjacent to the coloured blob the remaining pins being directly numbered across the base from Pin No. 1.
 E Alternative test figures are given for use when the valve shows signs of back emission from anode to G3. This phenomenon can be recognised by the anode current apparently decreasing as the valve heats.
 G Valves on the B8D base when leads are cut, should be tested either by insertion in a B8D Adaptor, or leads lengthened and tested in the same way as those with flexible leads, by using the special 9 clip valve holder.
 H Tests on tuning indicators should not be made until the resistor value (Ra), indicated in the remarks column, has been inserted across the link(s) on valve panel.
 J Use special 9 clip valve holder fitted to Valve Tester type 160.

Commercial Valve Index and Cross Reference to British Service Types

NOTE:—Many of the commercial equivalents listed in the following pages will have different CV numbers, this is due to special service requirements which do not affect the radio engineer, e.g. interelectrode capacitance, bulb size, life test, etc. It should also be noted that test data given in this manual may differ between equivalent valves, due to different sets of potentials having been selected for the test.

The inclusion of any particular Type, CV number or equivalent in this index does not necessarily imply that it is also included in the data section.
