THE AVO VALVE CHARACTERISTIC METER Mk II

FILAMENT VOLTAGE EXTENSION UNIT

VALVE BASE ADAPTORS

F O R E W O R D

This data manual is primarily intended for use with the “ AVO ” Valve Characteristic Meter and “ AVO ” Valve Tester, but once the Selector Switch code is known, the manual also forms a quick and convenient guide for general use.

The Instruction Book which accompanies the Valve Characteristic Meter should be thoroughly studied before the data contained in this manual is used in conjunction with the instrument, but as a convenient guide to the user who is already familiar with the full instruction book, abbreviated working instructions for the instrument are given in this publication. Abbreviated working instructions are also given for the “ AVO ” Valve Tester.

It is our intention to issue revised copies of this manual from time to time and dates of publication and price will be given in our advertisements in the Trade Press. If, in the interim periods between issues of this manual, a large number of new valves appear upon the market, amendment sheets will be issued at a small charge, whilst it may also be possible to give up-to-date information, on a number of valves, in our advertisements.

WATCH OUR ADVERTISEMENTS FOR FURTHER ANNOUNCEMENTS.

ABBREVIATED WORKING INSTRUCTIONS FOR THE "AVO" VALVE
CHARACTERISTIC METER.

The brief notes which follow are intended to act as a guide to the operator who has already studied, and is familiar with, the contents of the Instruction Manual issued with the instrument.

1. Check mains adjustment tap and connect mains lead to the supply, red and black leads are line and neutral, green or yellow, the Earth connection.
2. Set "CIRCUIT SELECTOR" to "CHECK (C)".
3. Set "METER SELECTOR" to 100 on outer scale.
4. Turn "SET ZERO" Control fully clockwise.
5. Set "FILAMENT VOLTAGE" switches to value indicated in Valve Data.
6. Set "ANODE VOLTS", "SCREEN VOLTS", and "GRID VOLTS" to values indicated in Valve Data.
7. Set "ROLLER SELECTOR" switch as indicated in Valve Data.
8. Switch "ON", press "RESET" button, release, and with "ELECTRODE LEAKAGE" switch at " $\sim$ " adjust movement pointer to position " $\sim$ " by means of "SET $\sim$ " switch.

ALL VALVES.

1. Insert Valve.
2. Fully rotate "ELECTRODE LEAKAGE" switch, check heater continuity at "H" and insulation on all other positions.
3. Set "CIRCUIT SELECTOR" at "CHECK (H)" to measure leakage from Heater/Cathode to all other electrodes strapped, with valve hot.
4. Turn "CIRCUIT SELECTOR" to "CHECK (H)" to measure leakage between heater and cathode with valve hot (if valve is indirectly heated).

TRIODES, DOUBLE TRIODES, DIODE TRIODES, PENTODES, DOUBLE PENTODES, DIODE PENTODES AND TETRODES IN SIMILAR COMBINATION.

ANODE CURRENT. Turn "ANODE SELECTOR" to " A_1 ". "CIRCUIT SELECTOR" to "TEST". Meter should then indicate "ANODE CURRENT". Reduce "METER SELECTOR" switch setting if required. If the meter lamps go out, do not press "RESET" button until you have checked for faulty settings on "ROLLER SELECTOR" switch. If these are in order, the valve is probably 'soft' and the test should proceed no further.

MUTUAL CONDUCTANCE. Reduce Meter reading to "ZERO" by means of the "SET ZERO" control. Press "mA/V" Button. Meter reading in milli-amps represents "MUTUAL CONDUCTANCE" in "mA/V". To test on "GOOD/BAD" scale, reduce meter readings to "ZERO" as before, turn "METER SELECTOR" switch to "mA/V" position. Adjust "SET mA/V" control to figure given in the Valve Data. Press "mA/V" Button. A good valve should read within the green band on the meter.

For double valves, check data for difference in electrode voltages and repeat above operation at A_2 .

GAS TEST. To measure Grid current, proceed as for mutual conductance, using "GOOD/BAD" scale. Reduce meter reading to "ZERO" by means of the "SET ZERO" control, press "mA/V" button, adjust meter reading to full scale by means of "SET mA/V" control. Release "mA/V" button, press "GAS" button. Full scale deflection will now represent 10 μ A Grid Current. For currents over 10 μ A use method given in full instruction book.

DIODES. To measure "DIODES" set the "METER SELECTOR" switch to 1 on inner ring of figures and "ANODE SELECTOR" switch to "A₁", turn "CIRCUIT SELECTOR" switch to "DIODE". Check double diodes at "A₁" and "A₂".

RECTIFIERS. Proceed as above to test for electrode leakage, heater/cathode leakage, etc. Using inner ring of figures, set "METER SELECTOR" switch to load shown in Valve Data, turn "CIRCUIT SELECTOR" switch to "REC" Good valves will read in green band on meter scale. Load reading is per anode.

TUNING INDICATORS. (MAGIC EYES). For testing data see page 95.

ABBREVIATED WORKING INSTRUCTIONS FOR THE “ AVO ” VALVE TESTER.

Although the “ Avo ” Valve Tester has been out of production for some years, the following operational notes will be of assistance to the user not entirely familiar with the instrument, and its employment in conjunction with this new data manual.

The data in the following pages for the “ AVO ” VALVE CHARACTERISTIC METER also gives sufficient information for the checking of valves with the “ AVO ” VALVE TESTER, referred to as the “ A.V.T.”

The data is presented in the following form :—

VALVE	SELECTOR SWITCH No.	T.C.	VF	VALVE CHARACTERISTIC METER DATA					A.V.T. DATA			BASE	TYPE
				Neg Grid Volts	Anode Volts	Screen Volts	Ia mA	mA/V	Anode Volts	Screen Volts	mA/V		

By taking no account of the data shown in the columns specifically marked Valve Characteristic Meter, the data applicable to the “ A.V.T.”, is obvious.

1. The voltage selector panel associated with the internal transformer in the meter unit should be set to match the voltage of the A.C. mains supply.
2. Before switching on, locate in this manual the line of data applicable to the valve to be tested and set the ANODE, SCREEN and HEATER switches to the voltages indicated. The SELECT ANODE switch should be set to “ NORMAL ”, “ A2 ”, “ D₁ ” or “ D₂ ” according to the test to be undertaken, the SET ZERO control turned fully anti-clockwise, the SET mA/V control set at 100, and the ROLLER SELECTOR SWITCH set up in accordance with the code number appearing in the data.
3. Switch on, noting that the neon indicator lights up indicating that the mains switch is on, and insert test lead plugs into the sockets in Meter Unit Panel. The neon lamp will now have been extinguished. If the Crocodile Clips at the remote ends of the leads are now connected to the valve pins in turn, shorts between the valve electrodes will be indicated by the neon lamp glowing. The test should not proceed further if shorts between electrodes (other than heater pins) are indicated.
4. Insert valve in correct socket upon valve panel and observe test procedure outlined below

P. & T. (Pentodes and Triodes).

As the valve warms up the initial anode current will be registered upon the meter and should be backed off to zero by means of the SET ZERO control. The SET mA/V control should now be set to “ mA/V ” and any adjustment required to return the needle to zero, made upon the SET ZERO control.

The toggle key is now depressed in the direction marked mA/V thus indicating the slope of the valve upon the “ mA/V ” scale. This reading should compare favourably with the figure given in the data.

The toggle key is now depressed in the direction marked C. INS. (for indirectly heated valves only) thus indicating cathode/heater insulation which should, for a good valve, be of the order of 5—10 MΩ (in the case of pentodes, for this test the SCREEN switch should be set at 60 or damage to the instrument and valve may result.).

DT, DDT, DP, DDP (Valves with another electrode assembly in addition to diode)

The mutual conductance of the triode or pentode section is checked with anode selector at "Normal". Emission figures for each diode are then obtained as below.

"†" See information given under the heading "Diodes" below.

TT and PP (Double Electrode Assemblies)

The mutual conductance of each half of such a valve is obtained with the anode selector at "Normal" and A_2 .

Where no mutual conductance figure is given, each half of valve should be checked for matching of mutual conductance.

R (Rectifiers)

To test rectifying valves for emission, set mA/V control at 100 and anode volts switch at "Rec". Emission of each anode (in case of full wave) will be obtained by setting anode selector at " D_1 " and " D_2 " respectively. The two emissions should match within small limits and can be compared with the figures given in the mA/V column which indicates the order of emission to be expected.

D, DD and DDD (Diodes)

These are tested for emission for each diode with anode volts switch at "D" and anode selector at " D_1 " and " D_2 ". Set "mA/V" control at "mA/V" when reading should be greater than 0.5 for a good diode. Readings will generally be between 2 and 5. Where the symbol "†" occurs amongst the selector switch set up figures, set to A_2 and test for emission of third diode with Anode Selector at A_2 .

Where D_1 or D_2 appears under the heading "Top Cap" these should be connected to top cap "A" and tested with the anode selector at "Normal".

		<i>Selector Switch</i>	<i>T.C.</i>	<i>Vf</i>	<i>Anode Volts</i>	<i>Base</i>	<i>Type</i>
E.g.	EA50	123 000 000	D_1	6	D	B3G	D

Connect to Anode Top Cap (A) and check for emission of Diode with Anode Selector at "Normal".

TH, TP, O (Frequency Changers)

To test frequency changers two sets of figures are given, first check the triode (Oscillator) section with the anode selector at "Normal" and then the pentode (mixer) section with the selector at A_2 .

SPECIAL NOTES

Due to the vast improvements in valve technique, the A.V.T. has limitations to its use. Notably the tendency to parasitic oscillations has greatly increased, and this should be borne in mind when high slope, short grid base valves of the all glass base construction are under test.

INTERNAL CONNECTION (*)

When the symbol * appears among the Selector Switch set up figures, it indicates that an unknown electrode may be connected to this pin internally. To obtain the complete Selector Switch coding, test with an ohmmeter between pin marked * and all others. (The ohmmeter should be on a sufficiently low range to discriminate between a dead short and filament resistance). Dependent upon the electrode to which this pin is internally connected the correct code can be set up and normal test procedure followed.

Where the pin marked * is O.C to all others Set Roller to 0.

1.4 Volt Dry Battery Valves

To obtain the filament supply for the 1.4V series, set the filament voltage switch to 10 volts and the toggle switch on the valve holder panel to ÷ 7 position. The toggle switch must always be returned to “Normal” after such tests. Where the Filament Voltage Extension Unit is used, 1.4 volts can be obtained direct by setting to 1.4 V, but in these circumstances the ÷ 7 toggle switch must be left at “Normal.”

Accessories for A.V.T.

Where the filament voltage is greater than that obtainable from the main panel, this can be obtained from the Avo Valve Tester Voltage Extension Unit which is supplied as an accessory.

If the valve base required does not appear on the Valve Holder Panel it is necessary to use an adaptor which plugs into the Octal Holder. These are supplied as follows :—

No. 1. B7G and B8A.	No. 4. B3G. Hivac D.A.4 and 5 pin.
No. 2. B9G.	No. 5. Blank.
No. 3. B8B.	No. 6. UX7 (6A7 Base).
	No. 7. B9A.

Special Note re use of V.B.A. No. 2

When using this data in conjunction with the B9G base, Pin 1 must be connected to H_+ , and Pin 8 connected to H_- . In these circumstances most types will give heater/cathode short which can be ignored. Apart from the filament connections referred to all other set up figures will remain as printed, but pin 9 should be connected to ϕ . Eg. EF50. Using Valve Base Adaptor No. 2. Selector Switch Number will read 356 101 420.

Note that the foregoing information does not apply to the now obsolete English and American panels without roller switch.

Range selection is by means of two rotary switches, for A.C. and D.C. respectively. A press button provides an additional range for each value of current and voltage shown on the switch knobs. Current consumption at full scale deflection is 1mA. or 2mA. according to whether press button is used or not. Total resistance is 500,000 ohms. By means of an external accessory (the Universal AvoMeter Power Factor and Wattage Unit) power factor and power can be measured in A.C. circuits. An automatic cut-out provides protection against damage through overload.

THE phenomenal progress of recent years in electrical engineering owes much to the contemporary advances in the design of electrical measuring instruments.

The equipment of a laboratory for making electrical measurements and tests can involve an expenditure of hundreds of pounds. Likewise the test gear essential to the work of the radio service engineer can also be a source of considerable expense.

This difficulty is largely surmounted, and other advantages are conferred, by the use of modern multi-range testing instruments, which afford maximum usefulness with a reasonable initial outlay.

"AVO" Instruments are scientifically designed on sound principles, being the outcome of many years of successful experience by the pioneers and leading manufacturers of multi-range instruments. Before leaving our factory, every "Avo" Instrument is tested and adjusted to give a high degree of accuracy and constancy of performance.

Model 8 Universal AVOMETER

A recent version of the Universal AvoMeter having a sensitivity of 20,000 ohms per volt on all D.C. ranges, and 1,000 ohms per volt on A.C. ranges from 100V. upwards. Accuracy on D.C. current ranges and A.C. ranges is to B.S. first grade, and on D.C. voltage ranges is 2% of indication from full scale to half scale deflection, and 1% of full scale value below half scale deflection.

In addition to the many well-known AvoMeter features, such as the automatic overload protection device, dual-knob range selection, etc., it has a push button for reversing the polarity of the movement to obviate the inconvenience of changing over the leads when encountering opposite potentials in respect to a common reference point.
